# 測試&再生晶圓 Test/Reclaim Wafer

## What is test and reclaim wafer?

The source of the reclaimed wafers comes from the monitor wafers and the dummy wafers but not the defect wafers manufactured by the semiconductor fab. The services we provide to refurbish these reclaimed wafers can dramatically lower the running cost of a semiconductor manufacturer.

The reclaimed wafers can be categorized according to functions as figure 1 and the reclamation system is shown as figure 2.

# 測試/再生晶圓 Test/Reclaim Wafer

**中砂的測試與再生晶圓之製程特色以延性輪磨(Ductile Mode Grinding)加工取代傳統研磨(Lapping)加工，目的是降低加工之變質層，減少化學藥品污染，且可提高加工精度，為最先進之再生晶圓製程。**

The features of the KINIK's test and reclaimed wafers are processed by ductile mode grinding used to replace traditional lapping to lower the damaged thickness on the surface and for less chemical contamination. The ductile mode grinding is the leading-edge process for the high precision reclaimed wafers.

# CMP鑽石碟 Diamond Disk

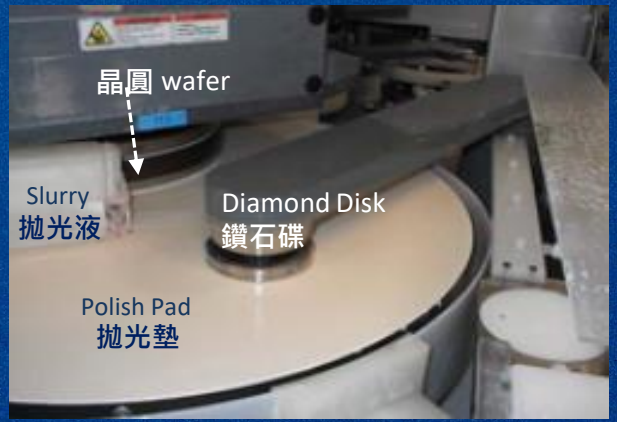

CMP (Chemical Mechanical Polish) 化學機械拋光，主要用於先進IC製程中，透過拋光墊與拋光液同時透過機械與化學反應加工晶圓表面，達到表面晶圓材料的移除及整體的平坦化，才能接續後續製程以及提高良率，進而能循摩爾定律持續微縮IC線寬面積，推展出N5/N3/N2先進製程。而**鑽石碟**的功用就是在拋光晶圓的同時去加工拋光墊，以移除拋光時的副產物及穩定拋光速率並提升良率及延長拋光墊使用壽命，是先進IC拋光製程中提升良率及控制成本中非常重要的一環。

CMP (Chemical Mechanical Polish) is widely used for advanced IC manufacturing processes for surface material removal, smoothing surfaces, and planarization by the polish pad (mechanical) and the abrasive slurry (chemical reaction). And the **diamond disk (aka pad conditioner)**'s function is to in-situ dress the polish pad during the process to remove the polish byproduct, to maintain a stable pad roughness and remove rate, to improve yield, and to prolong the lifetime of the pad.
